

Test Task: Build a Wallet & Transactions Admin Panel

Scenario

You are building an internal admin panel for a real-money gaming platform.

The platform has players from different countries using wallets to make deposits, withdrawals, and game transactions.

Your task is to design and build a simple working panel based on the sample data below.

Sample Data

Transact ion ID	Player ID	Count ry	Operat or	Type	Amou nt	Curren cy	Status	Balan ce After	Dat e
TX10001	PLR1001	Georgi a	Viper Direct	Deposit	50.00	EUR	Approv ed	50.00	20 Aug 202 6 10: 15
TX10002	PLR1002	Turkey	Operat or A	Deposit	25.00	EUR	Approv ed	25.00	20 Aug 202 6 10: 22
TX10003	PLR1001	Georgi a	Viper Direct	Game Entry	-5.00	EUR	Approv ed	45.00	20 Aug 202 6 10: 30
TX10004	PLR1003	Armeni a	Operat or B	Deposit	100.00	EUR	Pendin g	0.00	20 Aug 202 6 10: 45

TX10005	PLR1001	Georgia	Viper Direct	Game Win	18.50	EUR	Approved	63.50	20 Aug 2026 10:48
TX10006	PLR1004	Spain	Operator A	Withdrawal	-30.00	EUR	Approved	72.00	20 Aug 2026 11:05
TX10007	PLR1005	Germany	Operator C	Deposit	75.00	EUR	Failed	0.00	20 Aug 2026 11:20
TX10008	PLR1002	Turkey	Operator A	Game Entry	-10.00	EUR	Approved	15.00	20 Aug 2026 11:31
TX10009	PLR1002	Turkey	Operator A	Game Win	27.40	EUR	Approved	42.40	20 Aug 2026 11:35
TX10010	PLR1006	Italy	Operator C	Deposit	40.00	EUR	Approved	40.00	20 Aug 2026 11:52

TX10011	PLR1003	Armenia	Operator B	Deposit	100.00	EUR	Approved	100.00	20 Aug 2026 12:01
TX10012	PLR1003	Armenia	Operator B	Withdrawal	-60.00	EUR	Pending	100.00	20 Aug 2026 12:20

What You Need to Build

Create a simple web-based admin panel that:

- Stores this information in a database.
- Displays all transactions.
- Allows search and filtering by player, operator, country, status, transaction type and date.
- Shows the current balance of each player.
- Allows an authorized admin to add or update records.
- Shows basic summary information such as total deposits, withdrawals, game transactions and pending transactions.

You can redesign the data structure if you believe the provided format is not correct.

Important

We are not mainly evaluating UI design or coding speed.

We want to understand how you think as a Software Architect.

You should decide:

- Database structure.
- Backend and frontend architecture.
- How balances should be calculated and stored.
- How transaction consistency should be protected.
- How duplicate transactions should be handled.
- What should happen if two balance-changing transactions happen at the same time.
- What permissions/admin roles would be needed.

- What should be logged for auditing.
- What parts should never be directly editable.
- How the system could scale if transaction volume becomes much larger.

AI Usage

You can use Claude Code, Codex, Cursor, or other AI coding agents.

We want you to use AI as part of the task.

Please explain briefly:

- What you asked AI to build.
- What decisions you made yourself.
- What AI output you changed or rejected.
- How you checked that the generated solution was correct.

Final Result

Please provide:

1. Working panel.
2. Database/schema.
3. Source code.
4. Short architecture explanation.
5. Main risks or problems you identified.
6. What you would change before using this system in production.

The purpose of the task is to see how you design, direct AI, review its work, and make technical decisions, not how many lines of code you can write manually.

Good Luck 😊
